

INDEX: a status report

November 1999

Pravin Varaiya, Hal Varian
Richard Edell, Karyen Chu, Walter Beckert
EECS, SIMS, Economics at UC Berkeley

Motivation

Internet use currently has zero marginal cost for use

Result: congestion (see next slide)

Internet currently uses one quality of service (QoS)

Differential quality of service requires differential pricing

Research on QoS

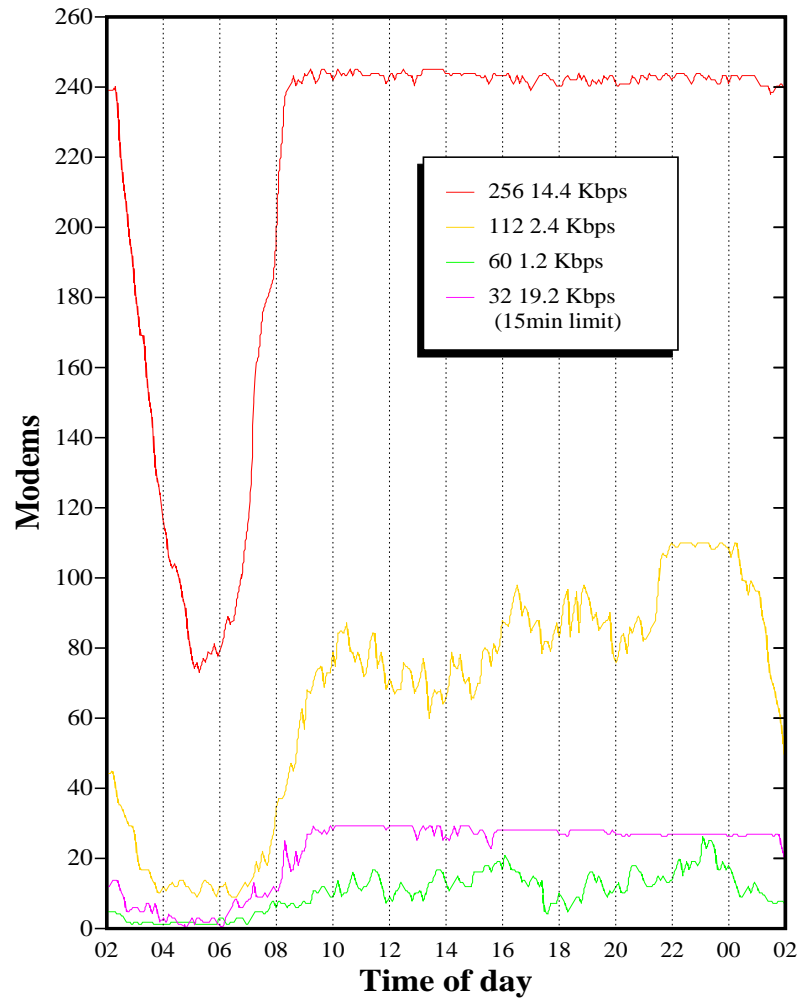

How to engineer QoS: a lot of work

What QoS costs: a little work

How users value QoS: nothing

Goal of INDEX project: measure how users value QoS

Modem use by day and user

Information about INDEX

INDEX = Internet DEMand eXperiment

Web page: <http://www.index.berkeley.edu>

Support: Cisco Systems, Pacific Bell, Hewlett Packard,
and National Science Foundation.

What is our goal?

Goal: Measure how much users are willing to pay for Internet Quality of Service (QoS).

Dimensions of QoS

bandwidth (symmetric and asymmetric)

volume

congestion

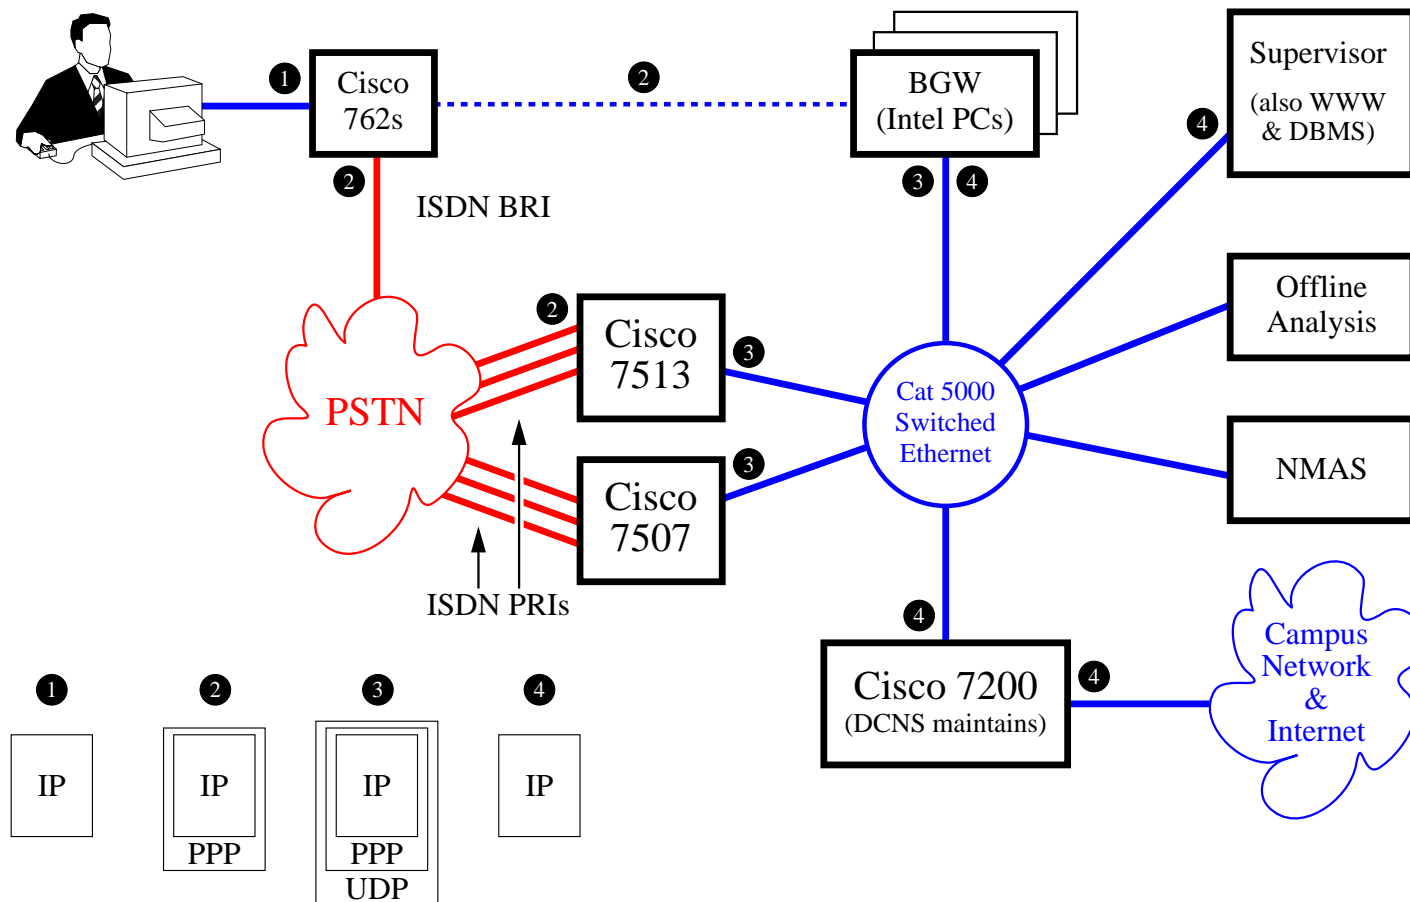

delay to connect

etc.

How do we do it?

- Give 150 Berkeley people "free" ISDN service
hardware and setup costs are free
we cover PacBell's monthly charges
- Offer them different QoS for different prices
- Simulate the QoS
same QoS choices for several weeks
different prices each week
- Note: *real* money, *simulated* service

Architecture

Interface for INDEX: settings

INDEX Project "Control Center"

File Help

Settings Experiment Prices Choices

Inactivity Timer

	Current	Limit	Enabled
Inactivity (in minutes)	0	60	<input checked="" type="checkbox"/>

Spending...

	Current	Limit	Enabled
this session (in dollars)	\$0.87	0.00	<input type="checkbox"/>
today (in dollars)	\$2.96	5.00	<input checked="" type="checkbox"/>
this month (in dollars)	\$2.96	35.00	<input checked="" type="checkbox"/>

Cancel Apply

Connection Status: Connected - 96kbps

Today: \$2.96

Interface: experiment

Interface: pricing

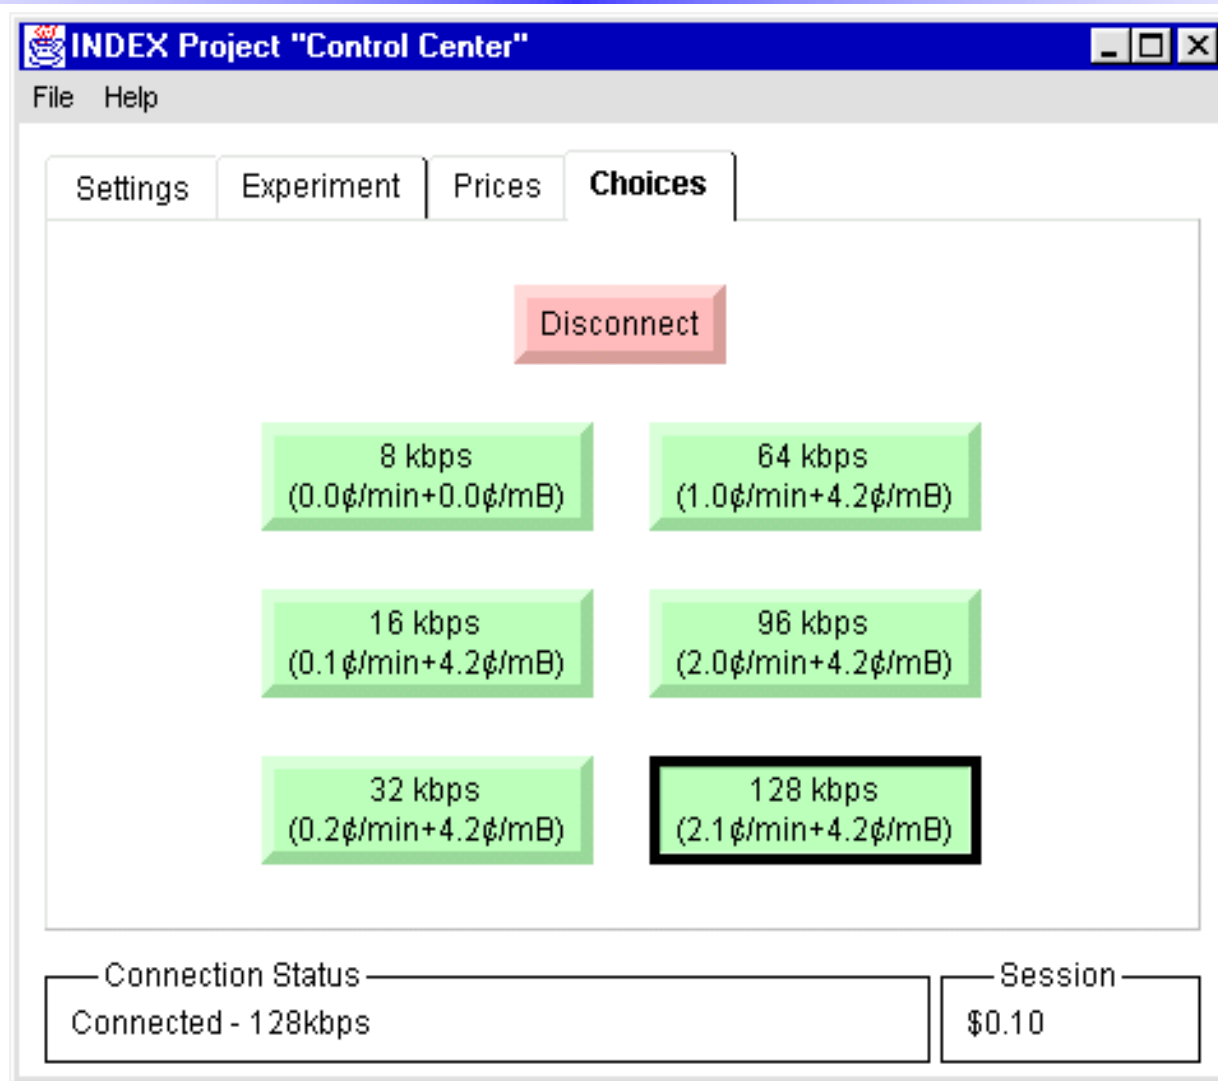

The screenshot shows a window titled "INDEX Project 'Control Center'". It has a menu bar with "File" and "Help". Below the menu bar are four tabs: "Settings", "Experiment", "Prices" (which is selected), and "Choices". The main content area displays the text "These prices are valid until 30-Nov-98 3:00:52 AM PST" above a table of services and prices. At the bottom, there are two status boxes: "Connection Status" showing "Connected - 128kbps" and "Session" showing "\$0.08".

Service	Price
8 kbps	0.0¢/min+0.0¢/mB
16 kbps	0.1¢/min+4.2¢/mB
32 kbps	0.2¢/min+4.2¢/mB
64 kbps	1.0¢/min+4.2¢/mB
96 kbps	2.0¢/min+4.2¢/mB
128 kbps	2.1¢/min+4.2¢/mB

Connection Status: Connected - 128kbps

Session: \$0.08

Interface: choices

Interface: asymmetric BW

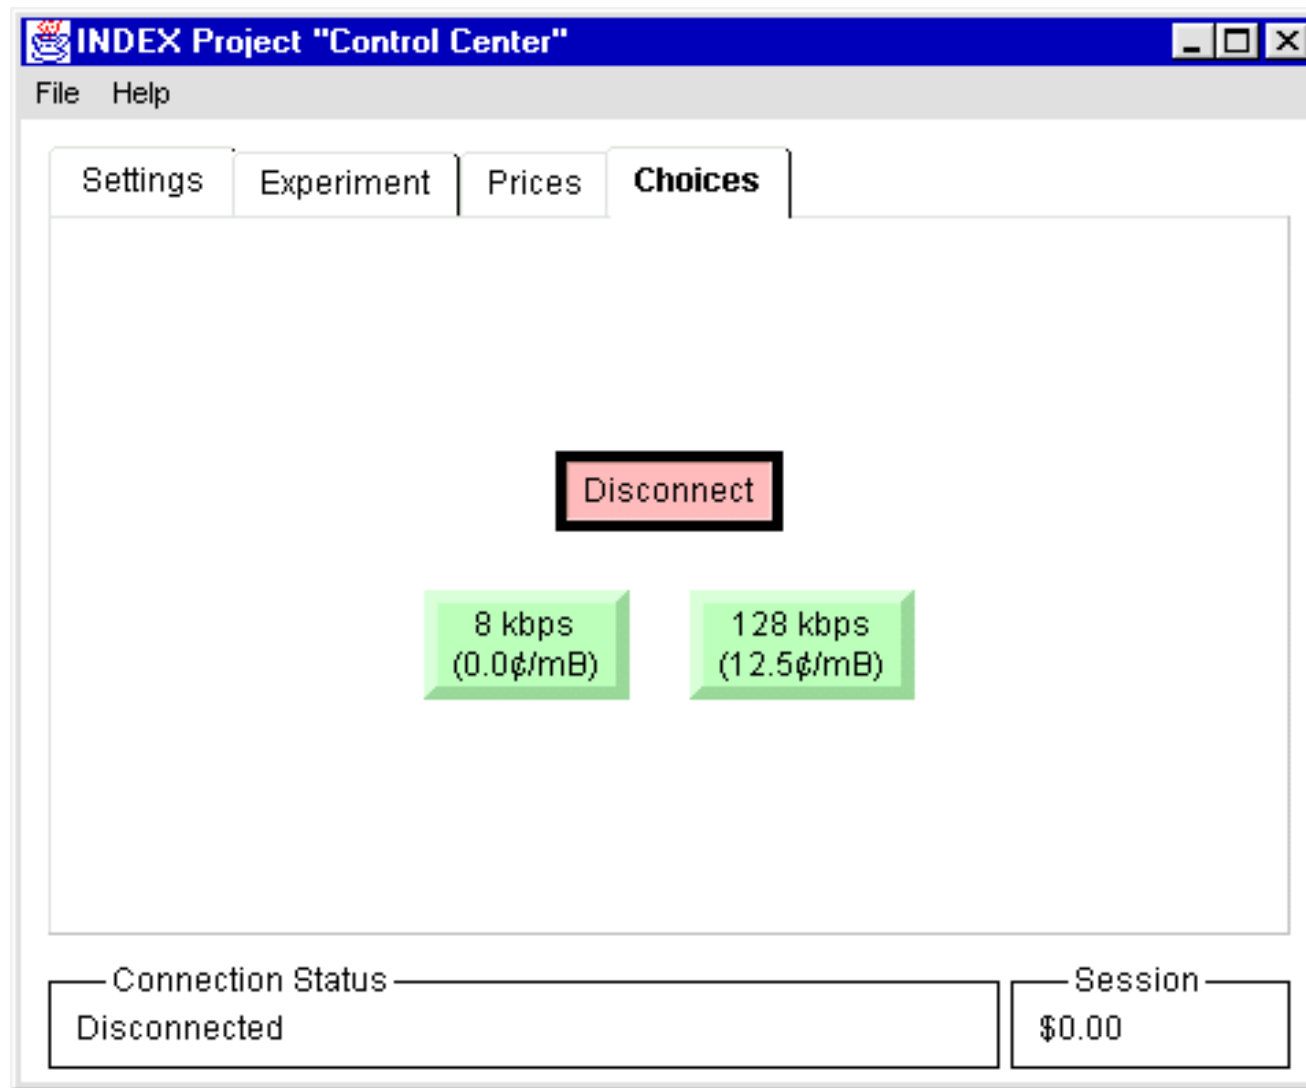

The screenshot shows a software window titled "INDEX Project 'Control Center'". It has a menu bar with "File" and "Help". Below the menu bar are four tabs: "Settings", "Experiment", "Prices", and "Choices". The "Choices" tab is active. A red "Disconnect" button is centered above two main panels: "Inbound" and "Outbound". Each panel contains a 3x2 grid of green buttons representing bandwidth options, each with a price of "(0.0¢/min)". In the "Inbound" panel, the "128 kbps" button is highlighted with a thick black border. In the "Outbound" panel, the "16 kbps" button is highlighted with a thick black border. At the bottom, there are two boxes: "Connection Status" showing "Connected - 128kbps inbound, 16kbps outbound" and "Session" showing "\$0.00".

Direction	Bandwidth	Price	Selected
Inbound	8 kbps	(0.0¢/min)	No
	16 kbps	(0.0¢/min)	No
	32 kbps	(0.0¢/min)	No
	64 kbps	(0.0¢/min)	No
	96 kbps	(0.0¢/min)	No
	128 kbps	(0.0¢/min)	Yes
Outbound	8 kbps	(0.0¢/min)	No
	16 kbps	(0.0¢/min)	Yes
	32 kbps	(0.0¢/min)	No
	64 kbps	(0.0¢/min)	No
	96 kbps	(0.0¢/min)	No
	128 kbps	(0.0¢/min)	No

Connection Status: Connected - 128kbps inbound, 16kbps outbound

Session: \$0.00

Interface: volume pricing

Interface: billing

09/15/1998	128kbps service	23:13:08-23:13:22			
	0.000 megabyte		0.001	0.0000	0.0000
09/15/1998	128kbps service	23:14:28-23:14:38			
	0.000 megabyte		0.001	0.0000	0.0000
09/15/1998	128kbps service	23:20:20-09/16 00:08:15			
	0.152 megabyte		0.001	0.0002	0.0002

Where we are

Started providing service April 1, 1998

- have about 70 subjects

- subjects proceed through experiments asynchronously

Have run

- symmetric bandwidth

- asymmetric bandwidth

- volume pricing

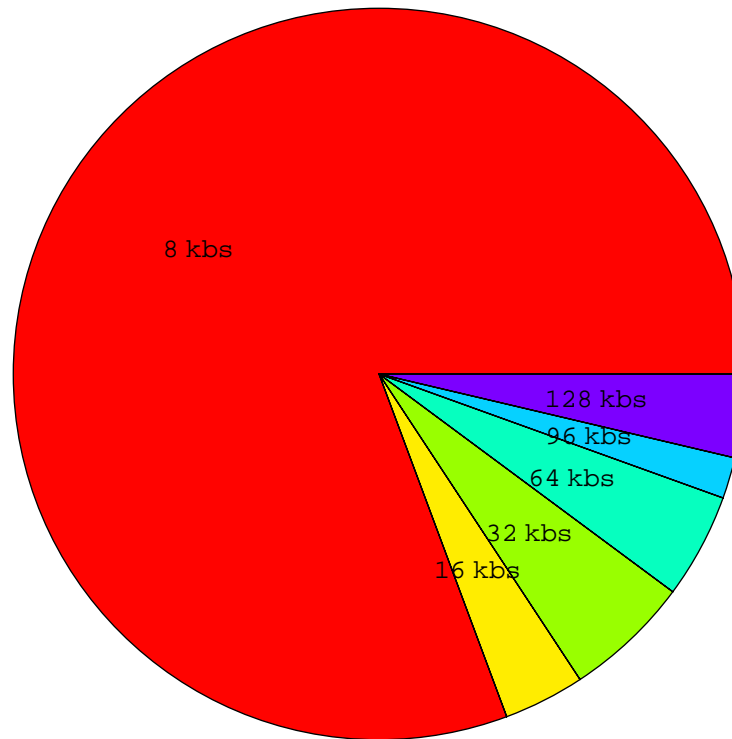

- bandwidth + volume mixture (predetermined + self-selected)

- pay upfront for flat pricing

Symmetric bandwidth

Usage overall:

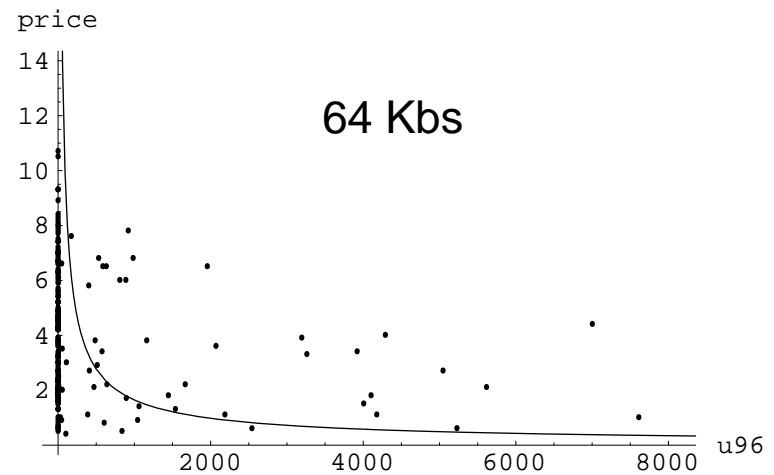

Note: 8 kbs is free

Scatter plots

Scatter plots, continued

Demand estimates

Reduced form: estimate demand as a function of price
amount consumed = function of prices and individual characteristics

Structural: estimate parameters of utility function
choice of bandwidth depends on value of time, urgency, etc. as well as price and characteristics

First look at reduced form, then examine some options for structural estimates

Log Regressions

u128 = -2.0p128 + .80p96 + .25p64 - .02p32 - .16p16
u96 = +1.7p128 -3.1p96 + .43p64 + .19p32 + .18p16
u64 = +.77p128 +1.8p96 -2.9p64 + .59p32 + .21p16
u32 = +.81p128 -1.0p96 +1.0p64 -1.4p32 + .15p16
u16 = +0.2p128 - .29p96 + .04p64 +1.2p32 -1.3p16

Red = negative own price effect

Light = not statistically significant

Lesson: *large* negative own price effect, positive cross price effect

How good is the fit?

	R^2	
	ISE	no ISE
u128	.95	.11
u96	.93	.25
u64	.92	.18
u32	.95	.14
u16	.90	.17

ISE = "individual specific effect"; interpretation

Conclusion: very good fits!

Structural estimates

Notation

b = bandwidth chosen

x = bits transferred

t = time at bandwidth $b = x/b$

$p(b)$ = price of bandwidth b

Utility

$u(x) - [c + p(b)]t$

c is value of time; varies with circumstances

$f(c)$ is probability distribution of c

Choice model

Let (x, b^*) be choice. Optimization requires:

$$u(x) - [c + p(b^*)] \frac{x}{b^*} \geq u(x) - [c + p(b)] \frac{x}{b} \quad \text{for all } b.$$

Rearrange to find

$$\min_{b^* < b} \frac{p(b^*)b - p(b)b^*}{b^* - b} \geq c \geq \max_{b^* > b} \frac{p(b^*)b - p(b)b^*}{b^* - b}$$

Note that this gives upper and lower bounds on cost of time.

Picture of estimation method

Plot $K(c) = [c + p(b_j)] (1/b_j)$ for $i = 1, \dots, n$

Observe (c_U^i, c_L^i, f^i) for $i = 1, \dots, n$

Histograms for one user

Distribution of time cost

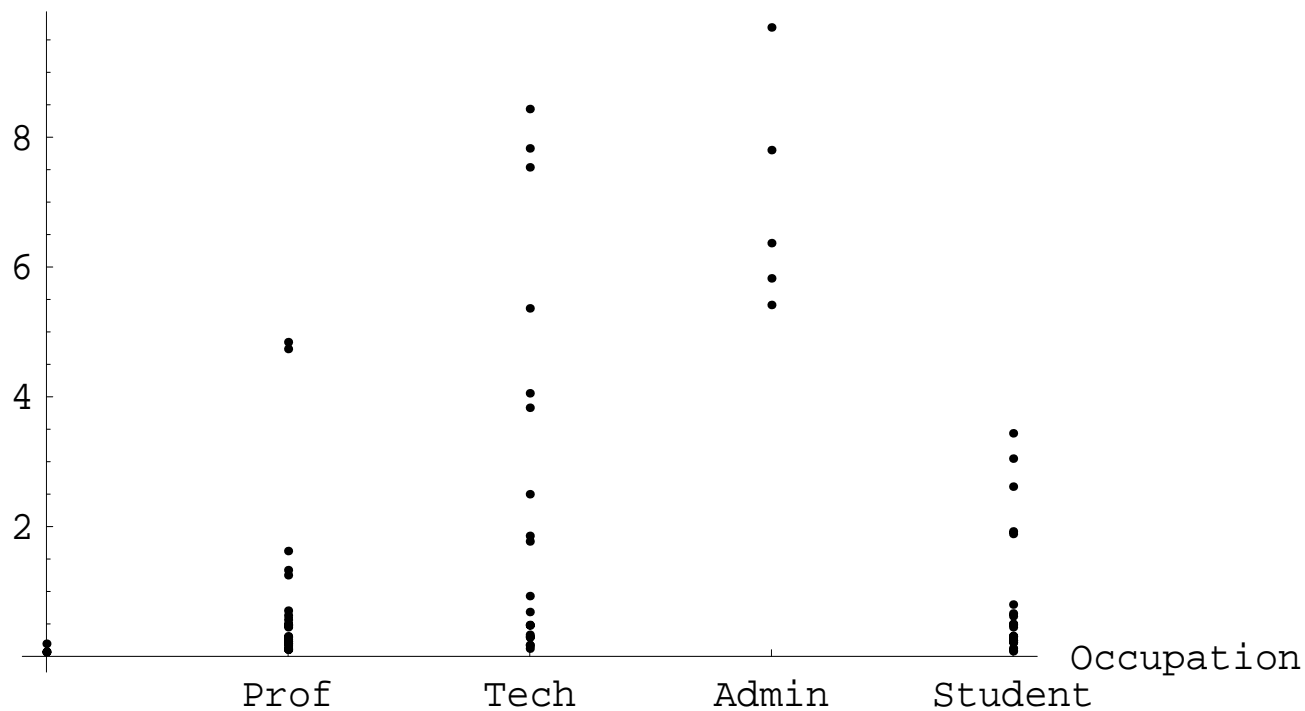

Can calculate average time cost for each individual using these frequency distributions.

Table shows number of subject with average estimated time cost that falls in indicated range:

Range	1	2	3	4	5	6	7	8	9	10	11	12
Upper bound	39	8	3	4	1	2	2	1	2	0	3	0
Lower bound	63	3	0	0	1	0	0	0	0	0	0	0
Average	47	7	2	3	3	3	1	3	1	1	0	0

Who has high WTP?

Est. Time Cost

Average cost of time

Very low WTP for time (= 1/2 cent per minute)

- very small charges induce large changes in behavior
- lot of low-value traffic out there
- admin/technical have highest WTP

WTP for population as a whole

$$cLowMean = 0.02$$

$$cUpMean = 0.40$$

$$cLowStd = 0.07$$

$$cUpStd = 1.11$$

Parametric fit

Suppose frequencies drawn from prob distribution $p(c, \beta)$

Find distribution that is close to all the frequencies

Closeness = Kullback-Leibler entropy measure, $\sum f \log p$

$$\max_{\beta} \sum_{i=1}^n f_i \log \int_{c_L^i}^{c_U^i} p(x, \beta) dx$$

Truncated Normal

$\mu=.487, \sigma=.32$

mean = .52

Picture of CDF

$\mu=.48, \sigma=.32$
max entropy

$\mu=.42, \sigma=.25$
min SSR

Entire Population

What about population as a whole?

cLowMean = 0.02, cUpMean = 0.40

cLowStd = 0.07, cUpStd = 1.11

Estimated parameters: $\mu = -.16$, $\sigma = .64$, mean time cost = .18

Why such a low WTP?

Possible explanations

1. Our population is not representative
can look at demographics, e.g., income effects
2. We only get lower bound on WTP for 128 kbs
but this is only about 1/6 of use
3. We can't control QoS outside of Berkeley network
high bandwidth isn't worth much if congestion is elsewhere
4. We can only measure value of *existing* applications

Volume experiments

Two bandwidths

8 Kbs for free

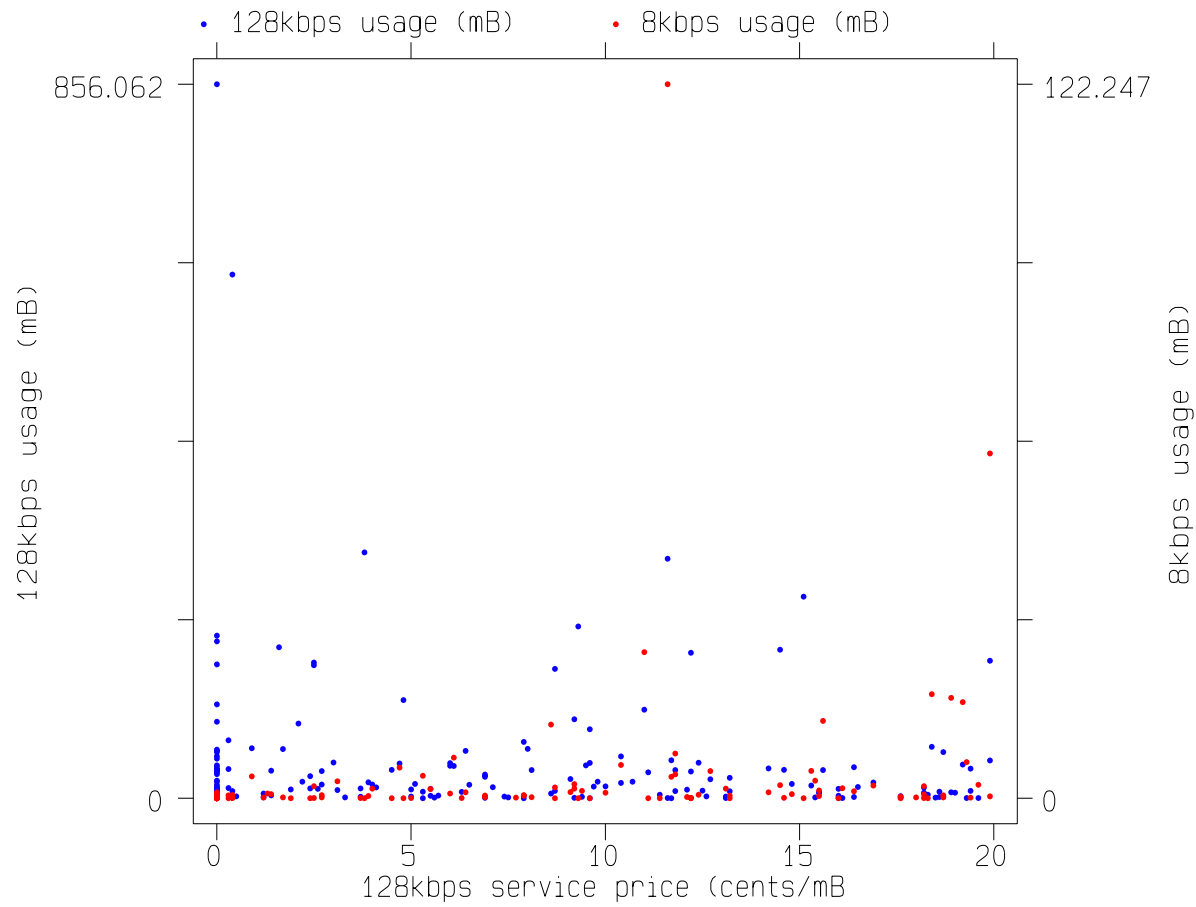

128 Kbs for money

Price volume downloaded

prices range from 1 to 20 cents per megabyte

monthly expenditures similar in bandwidth and volume experiments

Scatterplot

Log Regressions

no ISE: $u_{128} = -0.29$ p_{128} $R^2 = 0.02$

ISE: $u_{128} = -0.24$ p_{128} $R^2 = 1.00$

Interesting finding:

amount transmitted is not sensitive to price
entire effect is individual-specific effect

Why? Probably choice offered is too extreme...

What's next?

Current experiment: pay flat fee on Sunday to opt out of metered pricing

Move to ADSL or cable modem?

What are *you* interested in?
